

## Amapá Iron Ore Project, August 2022

### JORC Code, 2012 Edition

#### Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

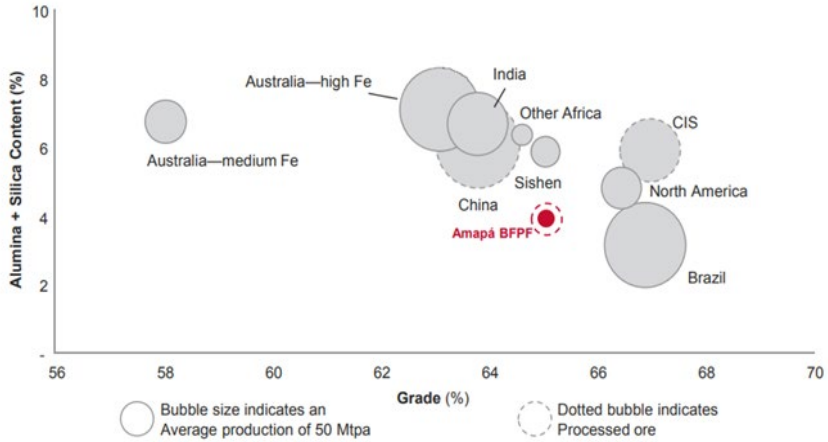

Criteria	JORC Code explanation	Commentary
<i>Mineral Resource estimate for conversion to Ore Reserves</i>	<ul style="list-style-type: none"> <li><i>Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.</i></li> <li><i>Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Mineral Resource estimate on which this Ore Reserve estimate has been based was prepared by Prominas Mining.</li> <li>The Measured and Indicated Mineral Resources for the Amapá Project, as prepared by Prominas Mining in 2022, have been used as the basis of the Ore Reserve Estimate.</li> <li>The Mineral Resource estimates are not in addition to the Ore Reserve estimate. The Ore Reserve estimate is a subset of the Mineral Resource estimate.</li> </ul>
<i>Site visits</i>	<ul style="list-style-type: none"> <li><i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i></li> <li><i>If no site visits have been undertaken indicate why this is the case.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Competent Person is Mr. Geraldo Majella Guimaraes (AIG), Prominas Mining associate professional, who worked on the site in the first years of Anglo American operations, auditing the data base in 2011 as a Coffey Mining consultant, and has visited the site most recently in April 2022 to verify the database, procedures and mine infrastructure.</li> <li>The Competent Person (Geraldo Majella Guimaraes) also visited the site in 2012 on behalf of Coffey Mining.</li> </ul>
<i>Study status</i>	<ul style="list-style-type: none"> <li><i>The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.</i></li> <li><i>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Ore Reserve estimation modifying factors were derived as part of the Project Pre-Feasibility that comprises environmental, mineral processing, geotechnical, hydrogeological, mine method, infrastructure, market and economic model information.</li> <li>Any material classified as an Inferred Mineral Resource was not included in any of the Pre-Feasibility study Ore Reserves calculations.</li> <li>The PFS demonstrated that the mine plan is technically achievable and economically viable. All material modifying factors were considered.</li> <li>The Mineral Resources have been converted to Ore Reserves by means of open pit optimisation and geotechnical study. Standard modifying factors as stated below were used.</li> </ul>
<i>Cut-off parameters</i>	<ul style="list-style-type: none"> <li><i>The basis of the cut-off grade(s) or quality parameters applied.</i></li> </ul>	<ul style="list-style-type: none"> <li>The mineral resources are reported within a conceptual pit shell at a Fe cut-off grade of 25%, which takes into account extraction scenarios and mineral processing recovery.</li> <li>The foreseen plant feed quality is about 39.73% Fe, 0.163 of P% and 7.58 of Al<sub>2</sub>O<sub>3</sub>.</li> </ul>
<i>Mining factors or assumptions</i>	<ul style="list-style-type: none"> <li><i>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</i></li> <li><i>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip,</i></li> </ul>	<ul style="list-style-type: none"> <li>The mining method for the Amapá Project remains a conventional truck and shovel open pit mine. There are no pre-strip requirements and site access preparations are minimal and will be carried out by a mining contractor.</li> <li>The ore will feed a conventional beneficiation plant with the waste being stored in an appropriate waste dump and the tailings being disposed of on the existing tailings dam.</li> <li>The final pit was generated using MinePlan® software that applies the Lerchs-Grossmann algorithm for the pit optimization process. The mine planning – sequencing – and pit design works were developed using the same software.</li> <li>The optimization cost parameters were derived from the current Pre-Feasibility study work and are outlined in the operation cost item below.</li> <li>Measured and Indicated Mineral Resource material blocks were assigned revenue values to drive the pit optimization shell.</li> <li>Only Friable material was considered for the Reserve estimate. Inferred Mineral Resource was not considered for pit optimization purposes.</li> <li>Ore Reserve tables are stated in wet metric tonnes (wmt). The moisture data were the same</li> </ul>

Criteria	JORC Code explanation	Commentary																																																																											
	<p>access, etc.</p> <ul style="list-style-type: none"> <li>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling.</li> <li>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</li> <li>The mining dilution factors used.</li> <li>The mining recovery factors used.</li> <li>Any minimum mining widths used.</li> <li>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</li> <li>The infrastructure requirements of the selected mining methods.</li> </ul>	<p>as considered on the Mineral Resource estimate. Refer to section above.</p> <ul style="list-style-type: none"> <li>A mining dilution factor of about 3.0% has been calculated and applied for the deposit. The methodology used considers blending the ore and waste blocks on the contacts of the ore body emulating the mine selectivity.</li> <li>A mining recovery factor of 94% has been calculated using the same methodology of mine dilution. The configuration of the deposit and the selected mining equipment will allow good mining recoveries to be achieved.</li> <li>The mine parameters were set to accommodate the selected CAT777 off-road trucks and are set out below. Free digging is expected in all friable itabirite and waste and as such the mining will be performed on nominal 4m benches, with final bench heights of 8m.</li> </ul> <table border="1" data-bbox="837 593 1316 817"> <thead> <tr> <th>Parameter</th> <th>Unit</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Berm Width</td> <td>m</td> <td>6.0</td> </tr> <tr> <td>Bench Height</td> <td>m</td> <td>8.0</td> </tr> <tr> <td>Ramp Width</td> <td>m</td> <td>25.0</td> </tr> <tr> <td>Ramp Gradient</td> <td>%</td> <td>10</td> </tr> <tr> <td>Mining dilution</td> <td>%</td> <td>3</td> </tr> <tr> <td>Mining recovery</td> <td>%</td> <td>94</td> </tr> </tbody> </table> <ul style="list-style-type: none"> <li>The used geo-mechanical zones are the same as considered for Mineral Resource estimate and are reproduced below. Market assessment	<ul style="list-style-type: none"> <li>The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.</li> <li>A customer and competitor analysis along with the identification of likely market windows for the product.</li> <li>Price and volume forecasts and the basis for these forecasts.</li> <li>For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract.</li> </ul>	<ul style="list-style-type: none"> <li>Cadence has undertaken an internal market analysis into the demand and pricing as shown below.</li> <li>Global steel demand is expected to grow by 11% over the next 20 years.</li> <li>India will be the leading source of growth, contributing to around 27% of total steel demand growth during 2020 – 2040.</li> <li>Globally, the BF-BOF route accounts for 73% of crude steel production and this will fall to 56% by 2035. On top of growing scrap supply, EAFs will, to some extent, be replaced by Direct Reduction Iron (DRI) and we expect consumption of DRI to grow by over 65% in the next 15 years.</li> <li>In 2021, China accounted for 55% of global crude steel production. This number is expected to decline to 35% by 2040 as the country's steel demand, particularly from the construction sector, declines. Europe, North America, and Developed Asia will maintain a market share of ≈25%, while India and Southeast Asia together more than doubling their share, from 9% to 21%.</li> <li>The supply of seaborne pellet feed has always been dominated by South America, specifically by Vale of Brazil. This dominance is clearly evident in 2008 with the region accounting for 98% of supply, and Vale alone accounting for 67% of all pellet feed exports globally. Vale, and other Brazilian producers (CSN, MMX and Samarco), are expected to expand capacity to meet seaborne demand over the forecast period. In addition, new producers are expected to emerge in Brazil producing pellet feed to serve the export market.</li> <li>The high-grade segment continues to be the focus for investors looking to invest in new iron ore projects. Several high-grade fines projects, as well as some pellet feed supply, are a step closer to production. These include new volumes from CSN in Brazil and Champion Iron in Canada.</li> <li>The Amapá Project intends to produce 4.4 Mtpa of 65% Blast Furnace Pellet Feed product (dry basis) and 0.9 Mtpa of 62% Spiral concentrate (dry basis). The high grade iron ore concentrates, free of hazardous constituents, which can be produced at Amapá, would be suitable for blast furnace feed pellet production. Historic sales and tests on Amapá iron-ore samples yielded a high quality concentrate with low contaminant content. The typical product quality produced by the Amapá Project is summarised in the next table.</li> </ul> <table border="1" data-bbox="762 1727 1382 1928"> <thead> <tr> <th>Item</th> <th>Blast Furnace Pellet Feed</th> <th>Fine Sinter feed (Spirals Concentrate)</th> <th>Total</th> </tr> </thead> <tbody> <tr> <td>Fe (%)</td> <td>65.37</td> <td>62.00</td> <td>64.78</td> </tr> <tr> <td>SiO<sub>2</sub> (%)</td> <td>1.42</td> <td>9.50</td> <td>2.82</td> </tr> <tr> <td>Al<sub>2</sub>O<sub>3</sub> (%)</td> <td>1.28</td> <td>1.00</td> <td>1.23</td> </tr> <tr> <td>Mn (%)</td> <td>0.82</td> <td>0.40</td> <td>0.75</td> </tr> <tr> <td>P (%)</td> <td>0.114</td> <td>0.080</td> <td>0.108</td> </tr> </tbody> </table>	Item	Blast Furnace Pellet Feed	Fine Sinter feed (Spirals Concentrate)	Total	Fe (%)	65.37	62.00	64.78	SiO <sub>2</sub> (%)	1.42	9.50	2.82	Al <sub>2</sub> O <sub>3</sub> (%)	1.28	1.00	1.23	Mn (%)	0.82	0.40	0.75	P (%)	0.114	0.080	0.108

Other	<ul style="list-style-type: none"> <li>● <i>To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves:</i></li> <li>● <i>Any identified material naturally occurring risks.</i></li> <li>● <i>The status of material legal agreements and marketing arrangements.</i></li> <li>● <i>The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.</i></li> </ul>	<ul style="list-style-type: none"> <li>● Procedures and costing are in place to deal with high rainfall events for the open pit operation and will not impact on the viability of extracting the Ore Reserve.</li> <li>● Due to the cessation of operations at DEV in 2014 / 2015 DEV entered judicial review. In 2019 DEV submitted a judicial recovery plan ("JRP") which was approved by the unsecured creditors in August 2019. The JRP is part of a regulated process under the laws of Brazil, in which the company under judicial review and investors can submit a recovery plan which will allow the company under judicial review, in this case DEV, to trade under a protected status while it recovers from its financial difficulties. The JRP provides a defined schedule of the payment of historic creditors. The JRP schedule contemplates the majority of the historic liabilities will be paid from free cash flow in years 7 to year 17 of operations. The JRP also limits the trade creditor liabilities.</li> <li>● In 2021 DEV and its investors agreed a settlement agreement with secured bank creditors. The original credit facility was entered into by DEV after the port collapse, and prior to the current investors ownership. The Settlement Agreement settles all of the principle amount plus all interest, default interest, outstanding costs and fees ("Settlement Amount"). The Credit Facility is secured over all of DEV's equity and assets. The Settlement Amount will be paid over two years from the effective date of the Settlement Agreement, and it is to be satisfied by the net profits from the sale of DEV's iron ore stockpiles. The Settlement Agreement will remain secured over all of DEV's equity and assets.</li> <li>● DEV has no marketing agreements in place. It has a 1% to 1.5% royalty on iron ore sales. This is calculated based on ex-works gross revenue.</li> <li>● DEV has Mining Concession of 3 mining rights (852.730/1993 - 858.010/1999 - 858.114/2004) and a request of one another mining right 858.075/2010. Subject to compliance with all of the required state and federal requirements DEV has the right to mine.</li> <li>● Prior the suspension of mining, the Project had 25 LOs across the mining, rail and port operations. These LOs expired between 2013 and 2018. DEV had also issued its EIA RIMA Studies (Environmental Impact Study (EIS), Environmental Control Plan and had its PAE approved.</li> <li>● Consultation with SEMA and the relevant state authorities DEV has requested that the requirement for EIA RIMA be waived. This is on the basis that the previous LO's were granted on an operation that is substantially the same as is currently planned and remains applicable to future operations. DEV is proposing that the Company submit Environmental Control Plan – PCA (Plano de Controle Ambiental); and Environmental Control Report RCA (Relatório de Controle Ambiental).</li> <li>● The state owns the railway line and associated land; therefore, for the Project to utilise this, it requires both the LO and a concession agreement with the State of Amapá. The previous operators of the Project were granted this concession in 2006 for 20 years under certain terms and conditions. The reinstatement of this concession to one of DEV 100% owned subsidiary occurred in December 2019 and extended the concession for 20 years.</li> <li>● The Company's port is regulated by the "Agencia Nacional de Transportes Aquaviários"</li> </ul>

Criteria	JORC Code explanation	Commentary																																																																																																																								
		<p>("ANTAQ"). As a result of the change of ultimate beneficiary of DEV, a change of control request was filed. This change of control was granted in November 2021. As part of the port change of control, ANTAQ has agreed to cease the recommended abrogation of the port concession.</p> <ul style="list-style-type: none"> <li>In Brazil, there is a distinct legal separation between surface and mineral rights. The private landowner has title to the surface rights, and the Federal Government owns all the mineral rights. The principle surface rights applicable to the Project are those above the Mining Concession and those associate with the railway from the mine to the port and the port in Santana, Amapá. The surface rights above the mining concessions are owned by numerous land owners which DEV has entered into agreements that permit it to mine,</li> <li>A leading privately owned utility provider will provide the power for the mine site and processing plant. This will require the upgrade of around 100 km of transmission lines and pylons. The Environmental licensing and easement rights for the transmission lines fall within their responsibility as a utility services provider.</li> </ul>
